

APPENDIX 6

Active Places Power Summary

APPENDIX 6: SPORT ENGLAND – ACTIVE PLACES POWER RESULTS

Summary

These are the findings from the APP strategic planning tool assessments as at mid March 2010. A combination of the local supply and demand balance tool and personal share tool has been used. These give an indication of the balance in supply and demand, but do not identify how much the deficit is, or where a facility would be best located. This can only be done via the Facilities Planning Model.

Sports Halls

Bromsgrove

A higher level of demand is met for sports hall space across Bromsgrove than either the national or regional averages, and overall the personal share ratio is also higher. However the distribution of halls means that access to facilities varies across the authority, with the rural area bordering Birmingham and north of Redditch falling below the national or regional averages. Part of this area will contain the new SUE to the north of Redditch, and this area should therefore be prioritised for access/new facilities.

New sports hall provision should be considered within the SUE area bordering Redditch and, if possible improved access to facilities should be enabled in the areas bordering Birmingham.

Malvern Hills

A higher level of demand for hall space has been met already in Malvern Hills than the national or regional average, but there is somewhat less access to halls in the rural areas. No ward falls below the national or regional averages for access to halls, but the worst supplied area is the area lying to the east of Worcester and northwards from there.

No additional sports hall space is required.

Redditch

Overall across the district, less demand from residents is met than either the national or regional averages. Many areas of the authority are below the national and regional averages for personal share, and only the area closest to Arrow Vale and on the central north side of the authority have provision approaching or above the national levels.

More sports hall space is needed across much of the authority, but particularly the central and western parts.

Worcester

A higher level of demand for hall space has been met already in Worcester than the national or regional average, but with slightly poorer access to halls in the north east, south and west

of the City. No where in the City falls below the “personal share” average levels of England or the West Midlands.

No additional sports hall space is required to meet community needs.

Wychavon

Lower levels of demand for sports halls are met within the district than the national or regional average, particularly across large rural areas in the district. However the personal share ratio's are better than the national or regional averages, with most people having access to a sports hall. The area most under pressure is to the south of the district, south of Evesham, but spreading east-west across the District.

Some additional sports hall space is required, particularly in the south.

Wyre Forest

Overall across the district, less demand from residents is met than either the national or regional averages. Many areas of the authority are below the national and regional averages for personal share, and only the area closest to Arrow Vale and on the central north side of the authority have provision approaching or above the national levels.

More sports hall space is needed particularly in the Bewdley, Stourport and Kidderminster areas.

Herefordshire

The level of demand met within the authority by the authority is lower than both the national and regional averages, but the ratio of personal share is higher on average across the authority. There are however large rural areas with poorer levels of personal share, particularly across the southern part of the authority, south of Hereford.

More sports hall space is needed to the south of Hereford, particularly in the rural areas.

Pools

Bromsgrove

The level of water space within the district means that the overall percentage of demand for swimming met is lower than the national or regional averages. However, reliance on pools outside the authority and their distribution means that the personal share of pool space is better than the regional average, though behind the national average. The least well provided areas are on the border of Birmingham and to the north of Redditch.

Some additional swimming pool space is required.

Redditch

The authority has lower levels of met demand and personal share of pool space than either the national or regional averages. The southern and central-east area of the authority is least well provided.

Additional pool space needed, ideally in the southern or central-east of the authority.

Malvern Hills

The district as a whole has lower levels of demand met within the district than the national or regional averages. However, access to pools outside the district means that the personal share of space is higher than either the national or regional averages, but the central belt of the authority's area has less provision is least well provided, and falls below the national and regional averages.

Additional water space is needed in the district to meet even the needs of the current population.

Worcester

With the inclusion of the Kings School pool in addition to the others, the overall level of demand met is theoretically greater than the national or regional averages per person. However the distribution of the pools and their opening hours means that the personal share of pool space is lower than the national or regional averages, with no areas of the city coming up to the national and regional average provision. There is particularly poor provision in the eastern and north-eastern part of the city.

More pool space is required.

Wychavon

Lower levels of demand for swimming pools are met within the district than the national or regional average. There is significant reliance on pools outside the authority, but there are many areas of the authority which need additional pool space. In particular, the rural areas to the east of the authority, and on the south side of Worcester.

Some additional water space needed.

Wyre Forest

With the inclusion of the large water area of The Glades, the met demand for swimming across the authority is well in excess of the national and regional averages. However the personal share ratio is close to the national average, although somewhat higher than the regional average. The area least well provided for is to the north of Kidderminster.

Some additional water space would be valuable to the north of Kidderminster.

Herefordshire

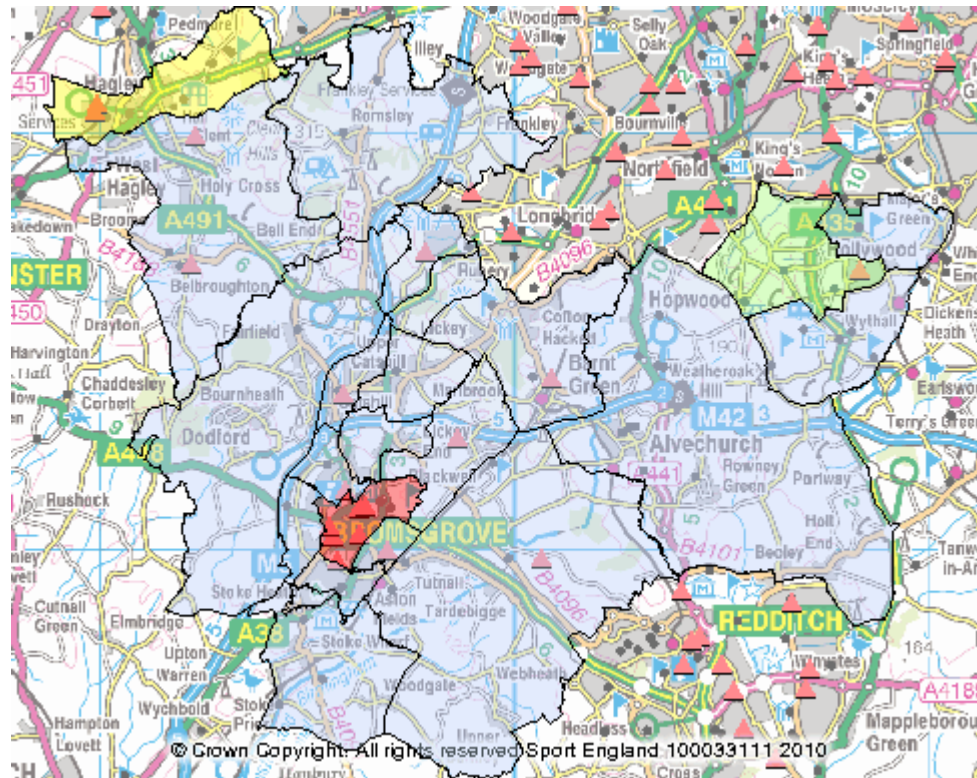

The levels of met demand on average across the authority are similar to the average for England, and higher than the regional average. The average personal share ratio for Herefordshire is however higher than for either England or the West Midlands, although there are areas with poor access in the central belt of the authority, running from the south west to the north east.

Some additional access to pools would be valuable in those areas with less good access.

Guidance Notes

Local Supply and Demand balance

Looks at Capacity of facilities, with capacity being based on visits per week during the peak period. The system uses the actual capacities of each facility, based on number (e.g. lanes), hours available in the peak period and duration of visit. What this analysis will show, is those areas where demand either outstrips current capacity e.g. there are not enough pools to meet current demand, or demand is less than current capacity e.g. there is a potential oversupply of pools. To get a clear picture of a local authority, you must look at those boroughs surrounding it, as very often a borough with oversupply may be located next to one with undersupply.

- Only available for facilities where demand information is available;
- Only looks at demand generated from population within local authority area and does not deal with demand being satisfied/exported by neighbouring boroughs (cross border);
- Capacity is based on Usage Parameters developed from 1997 survey of Sports Halls and Swimming Pools and Sport England Benchmarking Service (full list available for each facility type in Appendix 1 of User Guide);
- Population based on 2001 Census.

Personal Share of Facilities

This looks at the potential share of per person (in an output area) to the 'capacity of facilities'. The outputs show which residents have good access to facilities, in terms of available capacity.

- Only available for facilities where demand information is available;
- The map does not appear for output area centroids or 2km squares for any geographical area above a local authority;
- Capacity is based on Usage Parameters developed from the national Halls and Pools Survey and user data from Sport England Benchmarking Service (full list available for each facility type in Appendix 1 of User Guide);
- Population based on 2001 Census.
